FUTURE SAMPLING IN THE MARSHALLS FOR HASL

SYMBOL: NSA/JHM

The MRDL-NMRI group furnished us with some samples of soil and vegetation from Rongelap, Utrik and Eniola following the last series. These samples are being analyzed and we would like to obtain further sets as part of our trace element program. We would like to know if such operations would be possible under the program setup at IBM and what arrangements we should make for having such samples taken and delivered to us in New York.
